**Abstract** Soft set theory is a general mathematical tool for dealing with uncertain, fuzzy, not clearly defined objects. In this paper we introduced soft neutrosophic semigroup, soft neutrosophic bisemigroup, soft neutrosophic  $N$ -semigroup with the discussion of some of their characteristics. We also introduced a new type of soft neutrosophic semigroup, the so called soft strong neutrosophic semigroup which is of pure neutrosophic character. This notion also found in all the other corresponding notions of soft neutrosophic theory. We also given some of their properties of this newly born soft structure related to the strong part of neutrosophic theory.

**Keywords** Neutrosophic semigroup, neutrosophic bisemigroup, neutrosophic  $N$ -semigroup, soft set, soft semigroup, soft neutrosophic semigroup, soft neutrosophic bisemigroup, soft neutrosophic  $N$ -semigroup.

### §1. Introduction and preliminaries

Florentine Smarandache for the first time introduced the concept of neutrosophy in 1995, which is basically a new branch of philosophy which actually studies the origin, nature, and scope of neutralities. The neutrosophic logic came into being by neutrosophy. In neutrosophic logic each proposition is approximated to have the percentage of truth in a subset  $T$ , the percentage of indeterminacy in a subset  $I$ , and the percentage of falsity in a subset  $F$ . Neutrosophic logic is an extension of fuzzy logic. In fact the neutrosophic set is the generalization of classical set, fuzzy conventional set, intuitionistic fuzzy set, and interval valued fuzzy set. Neutrosophic logic is used to overcome the problems of impreciseness, indeterminate, and inconsistencies of date etc. The theory of neutrosophy is so applicable to every field of algebra. W. B. Vasantha Kandasamy and Florentin Smarandache introduced neutrosophic fields, neutrosophic rings, neutrosophic vector spaces, neutrosophic groups, neutrosophic bigroups and neutrosophic  $N$ -groups, neutrosophic semigroups, neutrosophic bisemigroups, and neutrosophic

$N$ -semigroups, neutrosophic loops, neutrosophic biloops, and neutrosophic  $N$ -loops, and so on. Mumtaz ali et al. introduced neutrosophic  $LA$ -semigroups.

Molodtsov introduced the theory of soft set. This mathematical tool is free from parameterization inadequacy, syndrome of fuzzy set theory, rough set theory, probability theory and so on. This theory has been applied successfully in many fields such as smoothness of functions, game theory, operation research, Riemann integration, Perron integration, and probability. Recently soft set theory attained much attention of the researchers since its appearance and the work based on several operations of soft set introduced in [2, 9, 10]. Some properties and algebra may be found in [1]. Feng et al. introduced soft semirings in [5]. By means of level soft sets an adjustable approach to fuzzy soft set can be seen in [6]. Some other concepts together with fuzzy set and rough set were shown in [7, 8].

This paper is about to introduced soft neutrosophic semigroup, soft neutrosophic group, and soft neutrosophic  $N$ -semigroup and the related strong or pure part of neutrosophy with the notions of soft set theory. In the proceeding section, we define soft neutrosophic semigroup, soft neutrosophic strong semigroup, and some of their properties are discussed. In the next section, soft neutrosophic bisemigroup are presented with their strong neutrosophic part. Also in this section some of their characterization have been made. In the last section soft neutrosophic  $N$ -semigroup and their corresponding strong theory have been constructed with some of their properties.

## §2. Definition and properties

**Definition 2.1.** Let  $S$  be a semigroup, the semigroup generated by  $S$  and  $I$  i.e.  $S \cup I$  denoted by  $\langle S \cup I \rangle$  is defined to be a neutrosophic semigroup where  $I$  is indeterminacy element and termed as neutrosophic element.

It is interesting to note that all neutrosophic semigroups contain a proper subset which is a semigroup.

**Example 2.1.** Let  $Z = \{\text{the set of positive and negative integers with zero}\}$ ,  $Z$  is only a semigroup under multiplication. Let  $N(S) = \{\langle Z \cup I \rangle\}$  be the neutrosophic semigroup under multiplication. Clearly  $Z \subset N(S)$  is a semigroup.

**Definition 2.2.** Let  $N(S)$  be a neutrosophic semigroup. A proper subset  $P$  of  $N(S)$  is said to be a neutrosophic subsemigroup, if  $P$  is a neutrosophic semigroup under the operations of  $N(S)$ . A neutrosophic semigroup  $N(S)$  is said to have a subsemigroup if  $N(S)$  has a proper subset which is a semigroup under the operations of  $N(S)$ .

**Theorem 2.1.** Let  $N(S)$  be a neutrosophic semigroup. Suppose  $P_1$  and  $P_2$  be any two neutrosophic subsemigroups of  $N(S)$  then  $P_1 \cup P_2$  (i.e. the union) the union of two neutrosophic subsemigroups in general need not be a neutrosophic subsemigroup.

**Definition 2.3.** A neutrosophic semigroup  $N(S)$  which has an element  $e$  in  $N(S)$  such that  $e * s = s * e = s$  for all  $s \in N(S)$ , is called as a neutrosophic monoid.

**Definition 2.4.** Let  $N(S)$  be a neutrosophic monoid under the binary operation  $*$ . Suppose  $e$  is the identity in  $N(S)$ , that is  $s * e = e * s = s$  for all  $s \in N(S)$ . We call a proper subset  $P$  of  $N(S)$  to be a neutrosophic submonoid if

1.  $P$  is a neutrosophic semigroup under  $*$ .
2.  $e \in P$ , i.e.,  $P$  is a monoid under  $*$ .

**Definition 2.5.** Let  $N(S)$  be a neutrosophic semigroup under a binary operation  $*$ .  $P$  be a proper subset of  $N(S)$ .  $P$  is said to be a neutrosophic ideal of  $N(S)$  if the following conditions are satisfied.

1.  $P$  is a neutrosophic semigroup.
2. For all  $p \in P$  and for all  $s \in N(S)$  we have  $p * s$  and  $s * p$  are in  $P$ .

**Definition 2.6.** Let  $N(S)$  be a neutrosophic semigroup.  $P$  be a neutrosophic ideal of  $N(S)$ ,  $P$  is said to be a neutrosophic cyclic ideal or neutrosophic principal ideal if  $P$  can be generated by a single element.

**Definition 2.7.** Let  $(BN(S), *, o)$  be a nonempty set with two binary operations  $*$  and  $o$ .  $(BN(S), *, o)$  is said to be a neutrosophic bisemigroup if  $BN(S) = P_1 \cup P_2$  where atleast one of  $(P_1, *)$  or  $(P_2, o)$  is a neutrosophic semigroup and other is just a semigroup.  $P_1$  and  $P_2$  are proper subsets of  $BN(S)$ , i.e.  $P_1 \subsetneq P_2$ .

If both  $(P_1, *)$  and  $(P_2, o)$  in the above definition are neutrosophic semigroups then we call  $(BN(S), *, o)$  a strong neutrosophic bisemigroup. All strong neutrosophic bisemigroups are trivially neutrosophic bisemigroups.

**Example 2.2.** Let  $(BN(S), *, o) = \{0, 1, 2, 3, I, 2I, 3I, S(3), *, o\} = (P_1, *) \cup (P_2, o)$  where  $(P_1, *) = \{0, 1, 2, 3, I, 2I, 3I, *\}$  and  $(P_2, o) = (S(3), o)$ . Clearly  $(P_1, *)$  is a neutrosophic semigroup under multiplication modulo 4.  $(P_2, o)$  is just a semigroup. Thus  $(BN(S), *, o)$  is a neutrosophic bisemigroup.

**Definition 2.8.** Let  $(BN(S) = P_1 \cup P_2; o, *)$  be a neutrosophic bisemigroup. A proper subset  $(T, o, *)$  is said to be a neutrosophic subbisemigroup of  $BN(S)$  if

1.  $T = T_1 \cup T_2$  where  $T_1 = P_1 \cap T$  and  $T_2 = P_2 \cap T$ .
2. At least one of  $(T_1, o)$  or  $(T_2, *)$  is a neutrosophic semigroup.

**Definition 2.9.** Let  $(BN(S) = P_1 \cup P_2, o, *)$  be a neutrosophic strong bisemigroup. A proper subset  $T$  of  $BN(S)$  is called the strong neutrosophic subbisemigroup if  $T = T_1 \cup T_2$  with  $T_1 = P_1 \cap T$  and  $T_2 = P_2 \cap T$  and if both  $(T_1, *)$  and  $(T_2, o)$  are neutrosophic subsemigroups of  $(P_1, *)$  and  $(P_2, o)$  respectively. We call  $T = T_1 \cup T_2$  to be a neutrosophic strong subbisemigroup, if atleast one of  $(T_1, *)$  or  $(T_2, o)$  is a semigroup then  $T = T_1 \cup T_2$  is only a neutrosophic subsemigroup.

**Definition 2.10.** Let  $(BN(S) = P_1 \cup P_2, *, o)$  be any neutrosophic bisemigroup. Let  $J$  be a proper subset of  $B(NS)$  such that  $J_1 = J \cap P_1$  and  $J_2 = J \cap P_2$  are ideals of  $P_1$  and  $P_2$  respectively. Then  $J$  is called the neutrosophic bi-ideal of  $BN(S)$ .

**Definition 2.11.** Let  $(BN(S), *, o)$  be a strong neutrosophic bisemigroup where  $BN(S) = P_1 \cup P_2$  with  $(P_1, *)$  and  $(P_2, o)$  be any two neutrosophic semigroups. Let  $J$  be a proper subset of  $BN(S)$  where  $I = I_1 \cup I_2$  with  $I_1 = J \cap P_1$  and  $I_2 = J \cap P_2$  are neutrosophic ideals of the neutrosophic semigroups  $P_1$  and  $P_2$  respectively. Then  $I$  is called or defined as the strong neutrosophic bi-ideal of  $B(N(S))$ .

Union of any two neutrosophic bi-ideals in general is not a neutrosophic bi-ideal. This is true of neutrosophic strong bi-ideals.

**Definition 2.12.** Let  $\{S(N), *_1, \dots, *_N\}$  be a non empty set with  $N$ -binary operations

defined on it. We call  $S(N)$  a neutrosophic  $N$ -semigroup ( $N$  a positive integer) if the following conditions are satisfied.

1.  $S(N) = S_1 \cup \dots \cup S_N$  where each  $S_i$  is a proper subset of  $S(N)$  i.e.  $S_i \subsetneq S_j$  or  $S_j \subsetneq S_i$  if  $i \neq j$ .

2.  $(S_i, *_i)$  is either a neutrosophic semigroup or a semigroup for  $i = 1, 2, \dots, N$ .

If all the  $N$ -semigroups  $(S_i, *_i)$  are neutrosophic semigroups (i.e. for  $i = 1, 2, \dots, N$ ) then we call  $S(N)$  to be a neutrosophic strong  $N$ -semigroup.

**Example 2.3.** Let  $S(N) = \{S_1 \cup S_2 \cup S_3 \cup S_4, *_1, *_2, *_3, *_4\}$  be a neutrosophic 4-semigroup where

$S_1 = \{Z_{12}, \text{semigroup under multiplication modulo } 12\}$ .

$S_2 = \{0, 1, 2, 3, I, 2I, 3I, \text{semigroup under multiplication modulo } 4\}$ , a neutrosophic semigroup.

$S_3 = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix}; a, b, c, d \in \langle R \cup I \rangle \right\}$ , neutrosophic semigroup under matrix multiplication and  $S_4 = \langle Z \cup I \rangle$ , neutrosophic semigroup under multiplication.

**Definition 2.13.** Let  $S(N) = \{S_1 \cup S_2 \cup \dots \cup S_N, *_1, \dots, *_N\}$  be a neutrosophic  $N$ -semigroup. A proper subset  $P = \{P_1 \cup P_2 \cup \dots \cup P_N, *_1, *_2, \dots, *_N\}$  of  $S(N)$  is said to be a neutrosophic Nsubsemigroup if  $P_i = P \cap S_i, i = 1, 2, \dots, N$  are subsemigroups of  $S_i$  in which atleast some of the subsemigroups are neutrosophic subsemigroups.

**Definition 2.14.** Let  $S(N) = \{S_1 \cup S_2 \cup \dots \cup S_N, *_1, \dots, *_N\}$  be a neutrosophic strong  $N$ -semigroup. A proper subset  $T = \{T_1 \cup T_2 \cup \dots \cup T_N, *_1, \dots, *_N\}$  of  $S(N)$  is said to be a neutrosophic strong sub  $N$ -semigroup if each  $(T_i, *_i)$  is a neutrosophic subsemigroup of  $(S_i, *_i)$  for  $i = 1, 2, \dots, N$  where  $T_i = T \cap S_i$ .

If only a few of the  $(T_i, *_i)$  in  $T$  are just subsemigroups of  $(S_i, *_i)$  (i.e.  $(T_i, *_i)$  are not neutrosophic subsemigroups then we call  $T$  to be a sub  $N$ -semigroup of  $S(N)$ .

**Definition 2.15.** Let  $S(N) = \{S_1 \cup S_2 \cup \dots \cup S_N, *_1, \dots, *_N\}$  be a neutrosophic  $N$ -semigroup. A proper subset  $P = \{P_1 \cup P_2 \cup \dots \cup P_N, *_1, \dots, *_N\}$  of  $S(N)$  is said to be a neutrosophic  $N$ -subsemigroup, if the following conditions are true,

- i.  $P$  is a neutrosophic sub  $N$ -semigroup of  $S(N)$ .
- ii. Each  $P_i = P \cap S_i, i = 1, 2, \dots, N$  is an ideal of  $S_i$ .

Then  $P$  is called or defined as the neutrosophic  $N$ -ideal of the neutrosophic  $N$ -semigroup  $S(N)$ .

**Definition 2.16.** Let  $S(N) = \{S_1 \cup S_2 \cup \dots \cup S_N, *_1, \dots, *_N\}$  be a neutrosophic strong  $N$ -semigroup. A proper subset  $J = \{I_1 \cup I_2 \cup \dots \cup I_N\}$  where  $I_t = J \cap S_t$  for  $t = 1, 2, \dots, N$  is said to be a neutrosophic strong  $N$ -ideal of  $S(N)$  if the following conditions are satisfied.

1. Each is a neutrosophic subsemigroup of  $S_t, t = 1, 2, \dots, N$  i.e. It is a neutrosophic strong N-subsemigroup of  $S(N)$ .
2. Each is a two sided ideal of  $S_t$  for  $t = 1, 2, \dots, N$ .

Similarly one can define neutrosophic strong  $N$ -left ideal or neutrosophic strong right ideal of  $S(N)$ .

A neutrosophic strong  $N$ -ideal is one which is both a neutrosophic strong  $N$ -left ideal and  $N$ -right ideal of  $S(N)$ .

Throughout this subsection  $U$  refers to an initial universe,  $E$  is a set of parameters,  $P(U)$  is the power set of  $U$ , and  $A \subset E$ . Molodtsov <sup>[12]</sup> defined the soft set in the following manner:

**Definition 2.17.** A pair  $(F, A)$  is called a soft set over  $U$  where  $F$  is a mapping given by  $F : A \rightarrow P(U)$ .

In other words, a soft set over  $U$  is a parameterized family of subsets of the universe  $U$ . For  $e \in A$ ,  $F(e)$  may be considered as the set of  $e$ -elements of the soft set  $(F, A)$ , or as the set of  $e$ -approximate elements of the soft set.

**Example 2.4.** Suppose that  $U$  is the set of shops.  $E$  is the set of parameters and each parameter is a word or sentence. Let  $E = \{\text{high rent, normal rent, in good condition, in bad condition}\}$ . Let us consider a soft set  $(F, A)$  which describes the attractiveness of shops that Mr.  $Z$  is taking on rent. Suppose that there are five houses in the universe  $U = \{h_1, h_2, h_3, h_4, h_5\}$  under consideration, and that  $A = \{e_1, e_2, e_3\}$  be the set of parameters where

$e_1$  stands for the parameter high rent.

$e_2$  stands for the parameter normal rent.

$e_3$  stands for the parameter in good condition.

Suppose that

$$F(e_1) = \{h_1, h_4\}.$$

$$F(e_2) = \{h_2, h_5\}.$$

$$F(e_3) = \{h_3, h_4, h_5\}.$$

The soft set  $(F, A)$  is an approximated family  $\{F(e_i), i = 1, 2, 3\}$  of subsets of the set  $U$  which gives us a collection of approximate description of an object. Thus, we have the soft set  $(F, A)$  as a collection of approximations as below:

$$(F, A) = \{\text{high rent} = \{h_1, h_4\}, \text{normal rent} = \{h_2, h_5\}, \text{in good condition} = \{h_3, h_4, h_5\}\}.$$

**Definition 2.18.** For two soft sets  $(F, A)$  and  $(H, B)$  over  $U$ ,  $(F, A)$  is called a soft subset of  $(H, B)$  if

1.  $A \subseteq B$ .
2.  $F(e) \subseteq G(e)$ , for all  $e \in A$ .

This relationship is denoted by  $(F, A) \tilde{\subset} (H, B)$ . Similarly  $(F, A)$  is called a soft superset of  $(H, B)$  if  $(H, B)$  is a soft subset of  $(F, A)$  which is denoted by  $(F, A) \tilde{\supset} (H, B)$ .

**Definition 2.19.** Two soft sets  $(F, A)$  and  $(H, B)$  over  $U$  are called soft equal if  $(F, A)$  is a soft subset of  $(H, B)$  and  $(H, B)$  is a soft subset of  $(F, A)$ .

**Definition 2.20.**  $(F, A)$  over  $U$  is called an absolute soft set if  $F(e) = U$  for all  $e \in A$  and we denote it by  $U$ .

**Definition 2.21.** Let  $(F, A)$  and  $(G, B)$  be two soft sets over a common universe  $U$  such that  $A \cap B \neq \phi$ . Then their restricted intersection is denoted by  $(F, A) \cap_R (G, B) = (H, C)$  where  $(H, C)$  is defined as  $H(c) = F(c) \cap G(c)$  for all  $c \in C = A \cap B$ .

**Definition 2.22.** The extended intersection of two soft sets  $(F, A)$  and  $(G, B)$  over a common universe  $U$  is the soft set  $(H, C)$ , where  $C = A \cup B$ , and for all  $e \in C$ ,  $H(e)$  is defined as

$$H(e) = \begin{cases} F(e), & \text{if } e \in A - B, \\ G(e), & \text{if } e \in B - A, \\ F(e) \cap G(e), & \text{if } e \in A \cap B. \end{cases}$$

We write  $(F, A) \cap_{\varepsilon} (G, B) = (H, C)$ .

**Definition 2.23.** The restricted union of two soft sets  $(F, A)$  and  $(G, B)$  over a common universe  $U$  is the soft set  $(H, C)$ , where  $C = A \cup B$ , and for all  $e \in C$ ,  $H(e)$  is defined as the soft set  $(H, C) = (F, A) \cup_R (G, B)$  where  $C = A \cap B$  and  $H(c) = F(c) \cup G(c)$  for all  $c \in C$ .

**Definition 2.24.** The extended union of two soft sets  $(F, A)$  and  $(G, B)$  over a common universe  $U$  is the soft set  $(H, C)$ , where  $C = A \cup B$ , and for all  $e \in C$ ,  $H(e)$  is defined as

$$H(e) = \begin{cases} F(e), & \text{if } e \in A - B, \\ G(e), & \text{if } e \in B - A, \\ F(e) \cup G(e), & \text{if } e \in A \cap B. \end{cases}$$

We write  $(F, A) \cup_{\varepsilon} (G, B) = (H, C)$ .

**Definition 2.25.** A soft set  $(F, A)$  over  $S$  is called a soft semigroup over  $S$  if  $(F, A) \overset{\wedge}{\circ} (F, A) \subseteq (F, A)$ .

It is easy to see that a soft set  $(F, A)$  over  $S$  is a soft semigroup if and only if  $\phi \neq F(a)$  is a subsemigroup of  $S$ .

**Definition 2.26.** A soft set  $(F, A)$  over a semigroup  $S$  is called a soft left (right) ideal over  $S$ , if  $(S, E) \subseteq (F, A)$ ,  $((F, A) \subseteq (S, E))$ .

A soft set over  $S$  is a soft ideal if it is both a soft left and a soft right ideal over  $S$ .

**Proposition 2.1.** A soft set  $(F, A)$  over  $S$  is a soft ideal over  $S$  if and only if  $\phi \neq F(a)$  is an ideal of  $S$ .

**Definition 2.27.** Let  $(G, B)$  be a soft subset of a soft semigroup  $(F, A)$  over  $S$ , then  $(G, B)$  is called a soft subsemigroup (ideal) of  $(F, A)$  if  $G(b)$  is a subsemigroup (ideal) of  $F(b)$  for all  $b \in A$ .

### §3. Soft neutrosophic semigroup

**Definition 3.1.** Let  $N(S)$  be a neutrosophic semigroup and  $(F, A)$  be a soft set over  $N(S)$ . Then  $(F, A)$  is called soft neutrosophic semigroup if and only if  $F(e)$  is neutrosophic subsemigroup of  $N(S)$ , for all  $e \in A$ .

Equivalently  $(F, A)$  is a soft neutrosophic semigroup over  $N(S)$  if  $(F, A) \overset{\wedge}{\circ} (F, A) \subseteq (F, A)$ , where  $\tilde{N}_{(N(S), A)} \neq (F, A) \neq \tilde{\phi}$ .

**Example 3.1.** Let  $N(S) = \langle Z^+ \cup \{0\}^+ \cup \{I\} \rangle$  be a neutrosophic semigroup under  $+$ . Consider  $P = \langle 2Z^+ \cup I \rangle$  and  $R = \langle 3Z^+ \cup I \rangle$  are neutrosophic subsemigroup of  $N(S)$ . Then clearly for all  $e \in A$ ,  $(F, A)$  is a soft neutrosophic semigroup over  $N(S)$ , where  $F(x_1) = \{\langle 2Z^+ \cup I \rangle\}$ ,  $F(x_2) = \{\langle 3Z^+ \cup I \rangle\}$ .

**Theorem 3.1.** A soft neutrosophic semigroup over  $N(S)$  always contain a soft semigroup over  $S$ .

**Proof.** The proof of this theorem is straight forward.

**Theorem 3.2.** Let  $(F, A)$  and  $(H, A)$  be two soft neutrosophic semigroups over  $N(S)$ . Then their intersection  $(F, A) \cap (H, A)$  is again soft neutrosophic semigroup over  $N(S)$ .

**Proof.** The proof is straight forward.

**Theorem 3.3.** Let  $(F, A)$  and  $(H, B)$  be two soft neutrosophic semigroups over  $N(S)$ . If  $A \cap B = \phi$ , then  $(F, A) \cup (H, B)$  is a soft neutrosophic semigroup over  $N(S)$ .

**Remark 3.1.** The extended union of two soft neutrosophic semigroups  $(F, A)$  and  $(K, B)$  over  $N(S)$  is not a soft neutrosophic semigroup over  $N(S)$ .

We take the following example for the proof of above remark.

**Example 3.2.** Let  $N(S) = \langle Z^+ \cup I \rangle$  be the neutrosophic semigroup under  $+$ . Take  $P_1 = \{\langle 2Z^+ \cup I \rangle\}$  and  $P_2 = \{\langle 3Z^+ \cup I \rangle\}$  to be any two neutrosophic subsemigroups of  $N(S)$ . Then clearly for all  $e \in A$ ,  $(F, A)$  is a soft neutrosophic semigroup over  $N(S)$ , where  $F(x_1) = \{\langle 2Z^+ \cup I \rangle\}$ ,  $F(x_2) = \{\langle 3Z^+ \cup I \rangle\}$ .

Again Let  $R_1 = \{\langle 5Z^+ \cup I \rangle\}$  and  $R_2 = \{\langle 4Z^+ \cup I \rangle\}$  be another neutrosophic subsemigroups of  $N(S)$  and  $(K, B)$  is another soft neutrosophic semigroup over  $N(S)$ , where  $K(x_1) = \{\langle 5Z^+ \cup I \rangle\}$ ,  $K(x_3) = \{\langle 4Z^+ \cup I \rangle\}$ .

Let  $C = A \cup B$ . The extended union  $(F, A) \cup_\varepsilon (K, B) = (H, C)$  where  $x_1 \in C$ , we have  $H(x_1) = F(x_1) \cup K(x_1)$  is not neutrosophic subsemigroup as union of two neutrosophic subsemigroup is not neutrosophic subsemigroup.

**Proposition 3.1.** The extended intersection of two soft neutrosophic semigroups over  $N(S)$  is soft neutrosophic semigroup over  $N(S)$ .

**Remark 3.2.** The restricted union of two soft neutrosophic semigroups  $(F, A)$  and  $(K, B)$  over  $N(S)$  is not a soft neutrosophic semigroup over  $N(S)$ .

We can easily check it in above example.

**Proposition 3.2.** The restricted intersection of two soft neutrosophic semigroups over  $N(S)$  is soft neutrosophic semigroup over  $N(S)$ .

**Proposition 3.3.** The *AND* operation of two soft neutrosophic semigroups over  $N(S)$  is soft neutrosophic semigroup over  $N(S)$ .

**Proposition 3.4.** The *OR* operation of two soft neutrosophic semigroup over  $N(S)$  may not be a soft neutrosophic semigroup over  $N(S)$ .

## Conclusion

This paper is an extension of neutrosophic semigroup to soft semigroup. We also extend neutrosophic bisemigroup, neutrosophic  $N$ -semigroup to soft neutrosophic bisemigroup, and soft neutrosophic  $N$ -semigroup. Their related properties and results are explained with many illustrative examples, the notions related with strong part of neutrosophy also established within soft semigroup.
