Abstract

This paper investigates multi–objective Neutrosophic Goal Optimization (NSGO) approach to optimize the cost of welding and deflection at the tip of a welded steel beam, while the maximum shear stress in the weld group, maximum bending stress in the beam, and buckling load of the beam have been considered as constraints. The problem of designing an optimal welded beam consists of dimensioning a welded steel beam and the welding length so as to minimize its cost, subject to the constraints as stated above. The classical welded beam design structure is presented here in to demonstrate the efficiency of the neutrosophic goal programming approach. The model is numerically illustrated by generalized NSGO technique with different aggregation method. The result shows that the Neutrosophic Goal Optimization technique is very efficient in finding the best optimal solutions.

1. INTRODUCTION

Welding, a process of joining metallic parts with the application of heat or pressure or the both, with or without added material, is an economical and efficient method for
obtaining permanent joints in the metallic parts. This welded joints are generally used as a substitute for riveted joint or can be used as an alternative method for casting or forging. The welding processes can broadly be classified into following two groups, the welding process that uses heat alone to join two metallic parts and the welding process that uses a combination of heat and pressure for joining (Bhandari, V. B). However, above all the design of welded beam should preferably be economical and durable one. Since decades, deterministic optimization has been widely used in practice for optimizing welded connection design. These include mathematical optimization algorithms (Ragsdell & Phillips 1976) such as APPROX (Griffith & Stewart’s) successive linear approximation, DAVID (Davidon Fletcher Powell with a penalty function), SIMPLEX (Simplex method with a penalty function), and RANDOM (Richardson’s random method) algorithms, GA-based methods (Deb 1991, Deb 2000, Coello 2000b, Coello 2008), particle swarm optimization (Reddy 2007), harmony search method (Lee & Geem 2005), and Big-Bang Big-Crunch (BB-BC) (O. Hasançebi, 2011) algorithm. SOPT (O. Hasançebi, 2012), subset simulation (Li 2010), improved harmony search algorithm (Mahdavi 2007), were other methods used to solve this problem. Recently a robust and reliable $H_{\infty}$ static output feedback (SOF) control for nonlinear systems (Yanling Wei 2016) and for continuous-time nonlinear stochastic systems (Yanling Wei 2016) with actuator fault in a descriptor system framework have been studied. All these deterministic optimizations aim to search the optimum solution under given constraints without consideration of uncertainties. So, while a deterministic optimization approach is unable to handle structural performances such as imprecise stresses and deflection etc. due to the presence of uncertainties, to get rid of such problem fuzzy (Zadeh, 1965), intuitionistic fuzzy (Atanassov,1986), Neutrosophic (Smarandache,1995) play great roles.

Traditionally structural design optimization is a well known concept and in many situations it is treated as single objective form, where the objective is known the weight or cost function. The extension of this is the optimization where one or more constraints are simultaneously satisfied next to the minimization of the weight or cost function. This does not always hold good in real world problems where multiple and conflicting objectives frequently exist. In this consequence a methodology known as multi-objective optimization (MOSO) is introduced

So to deal with different impreciseness such as stresses and deflection with multiple objective, we have been motivated to incorporate the concept of neutrosophic set in this problem, and have developed multi-objective neutrosophic optimization algorithm to optimize the optimum design.

Usually Intuitionistic fuzzy set, which is the generalization of fuzzy sets, considers both truth membership and falsity membership that can handle incomplete information excluding the indeterminate and inconsistent information while neutrosophic set can quantify indeterminacy explicitly by defining truth, indeterminacy and falsity membership function independently. Therefore, Wang et.al (2010) presented such set as single valued neutrosophic set (SVNS) as it comprised of

As application of SVNS optimization method is rare in welded beam design, hence it is used to minimize the cost of welding by considering shear stress, bending stress in the beam, the buckling load on the bar, the deflection of the beam as constraints. Therefore the result has been compared among three cited methods in each of which impreciseness has been considered completely in different way.

Moreover using above cited concept, a multi-objective neutrosophic optimization algorithm has been developed to optimize three bar truss design (Sarkar 2016), and to optimize riser design problem (Das 2015). In early 1961 Charnes and Cooper first introduced Goal programming problem for a linear model. Usually conflicting goal are presented in a multi-objective goal programming problem. Dey et al.(2015) used intuitionistic goal programming on nonlinear structural model.

However, the factors governing of former constraints are height and length of the welded beam, forces on the beam, moment of load about the centre of gravity of the weld group, polar moment of inertia of the weld group respectively. While, the second constraint considers forces on the beam, length and size of the weld, depth and width of the welded beam respectively. Third constraint includes height and width of the welded beam. Fourth constraints consists of height, length, depth and width of the welded beam. Lastly fifth constraint includes height of the welded beam. Besides, flexibility has been given in shear stress, bending stress and deflection only, hence all these parameters become imprecise in nature so that it can be considered as neutrosophic set to from truth, indeterminacy and falsity membership functions Ultimately, neutrosophic optimization technique has been applied on the basis of the cited membership functions and outcome of such process provides the minimum cost of welding ,minimum deflection for nonlinear welded beam design. The comparison of results shows difference between the optimum value when partially unknown information is fully considered or not. This is the first time NSGO technique is in application to multi-objective welded beam design. The present study investigates computational algorithm for solving multi-objective welded beam problem by single valued generalized NSGO technique. The results are compared numerically for different aggregation method of NSGO technique. From our numerical result, it has been seen that the best result obtained for geometric aggregation method for NSGO technique in the perspective of structural optimization technique.

2. MULTI-OBJECTIVE STRUCTURAL MODEL

In sizing optimization problems, the aim is to minimize multi objective function, usually the cost of the structure, deflection under certain behavioural constraints which are displacement or stresses. The design variables are most frequently chosen to be dimensions of the height, length, depth and width of the structures. Due to fabrications limitations the design variables are not continuous but discrete for
belongingness of cross-sections to a certain set. A discrete structural optimization
problem can be formulated in the following form

Minimize \( C(X) \)

\[
\text{Minimize } \delta(X)
\]

subject to \( \sigma_i(X) \leq \left[ \sigma_i(X) \right],\ i = 1,2,\ldots,m \)

\( X_j \in R^d, \ j = 1,2,\ldots,n \)

where \( C(X), \delta(X) \) and \( \sigma_i(X) \) as represent cost function, deflection and the
behavioural constraints respectively whereas \( \left[ \sigma_i(X) \right] \) denotes the maximum
allowable value, ‘m’ and ‘n’ are the number of constraints and design variables
respectively. A given set of discrete value is expressed by \( R^d \) and in this paper
objective functions are taken as

\[
C(X) = \sum_{t=1}^{T} c_i \prod_{n=1}^{m} x_n^{\sigma_i} \text{ and } \delta(X)
\]

and constraint are chosen to be stress of structures as follows

\( \sigma_i(A) \leq \sigma_i \) with allowable tolerance \( \sigma_i^{0} \) for \( i = 1,2,\ldots,m \)

Where \( c_i \) is the cost coefficient of \( t^{th} \) side and \( x_n \) is the \( n^{th} \) design variable
respectively, \( m \) is the number of structural element, \( \sigma_i \) and \( \sigma_i^{0} \) are the \( i^{th} \) stress,
allowable stress respectively.

3. MATHEMATICAL PRELIMINARIES

3.1. Fuzzy Set

Let \( X \) be a fixed set. A fuzzy set \( A \) set of \( X \) is an object having the form

\( \tilde{A} = \{(x,T_A(x)) : x \in X\} \) where the function \( T_A : X \rightarrow [0,1] \) defined the truth
membership of the element \( x \in X \) to the set \( A \).

3.2. Intuitionistic Fuzzy Set

Let a set \( X \) be fixed. An intuitionistic fuzzy set or IFS \( \tilde{A}^I \) in \( X \) is an object of the form

\( \tilde{A}^I = \{<X,T_A(x),F_A(x)> | x \in X\} \) where \( T_A : X \rightarrow [0,1] \) and \( F_A : X \rightarrow [0,1] \)
define the truth membership and falsity membership respectively, for every element of 
\(x \in X\), \(0 \leq T_A(x) + F_A(x) \leq 1\).

3.3. Neutrosophic Set
Let a set \(X\) be a space of points (objects) and \(x \in X\). A neutrosophic set \(\tilde{A}\) in \(X\) is defined by a truth membership function \(T_A(x)\), an indeterminacy-membership function \(I_A(x)\) and a falsity membership function \(F_A(x)\) and having the form \(\tilde{A} = \{<x,T_A(x),I_A(x),F_A(x)>|x \in X\}\). \(T_A(x)\), \(I_A(x)\) and \(F_A(x)\) are real standard or non-standard subsets of \([0,1]\). That is
\[
T_A(x) : X \to [0^-, 1^+]
I_A(x) : X \to [0^-, 1^+]
F_A(x) : X \to [0^-, 1^+]
\]
There is no restriction on the sum of \(T_A(x), I_A(x)\) and \(F_A(x)\) so
\(0^- \leq \sup T_A(x) \leq \sup I_A(x) \leq \sup F_A(x) \leq 3^+\).

3.4. Single Valued Neutrosophic Set
Let a set \(X\) be the universe of discourse. A single valued neutrosophic set \(\tilde{A}\) over \(X\) is an object having the form \(\tilde{A} = \{<x,T_A(x),I_A(x),F_A(x)>|x \in X\}\) where \(T_A : X \to [0,1], I_A : X \to [0,1]\) and \(F_A : X \to [0,1]\) with
\(0 \leq T_A(x) + I_A(x) + F_A(x) \leq 3\) for all \(x \in X\).

3.4. Single Valued Generalized Neutrosophic Set
Let a set \(X\) be the universe of discourse. A single valued neutrosophic set \(\tilde{A}\) over \(X\) is an object having the form \(\tilde{A} = \{<x,T_A(x),I_A(x),F_A(x)>|x \in X\}\) where \(T_A : X \to [0, w_1], I_A : X \to [0, w_2]\) and \(F_A : X \to [0, w_3]\) with
\(0 \leq T_A(x) + I_A(x) + F_A(x) \leq w_1 + w_2 + w_3\) where \(w_1, w_2, w_3 \in [0,1]\) for all \(x \in X\).

3.5. Complement of Neutrosophic Set
Complement of a single valued neutrosophic set \(A\) is denoted by \(c(A)\) and is defined
\(T_{c(A)}(x) = F_A(x)\)
by \(I_{c(A)}(x) = 1 - F_A(x)\)
\(F_{c(A)}(x) = T_A(x)\)
3.6. Union of Neutrosophic Sets
The union of two single valued neutrosophic sets \( A \) and \( B \) is a single valued neutrosophic set \( C \), written as \( C = A \cup B \), whose truth membership, indeterminacy-membership and falsity-membership functions are given by
\[
T_{c,A}(x) = \max(T_A(x), T_B(x)) \\
I_{c,A}(x) = \max(I_A(x), I_B(x)) \\
F_{c,A}(x) = \min(F_A(x), F_B(x)) \quad \text{for all } x \in X
\]

3.7. Intersection of Neutrosophic Sets
The intersection of two single valued neutrosophic sets \( A \) and \( B \) is a single valued neutrosophic set \( C \), written as \( C = A \cap B \), whose truth membership, indeterminacy-membership and falsity-membership functions are given by
\[
T_{c,A}(x) = \min(T_A(x), T_B(x)) \\
I_{c,A}(x) = \min(I_A(x), I_B(x)) \\
F_{c,A}(x) = \max(F_A(x), F_B(x)) \quad \text{for all } x \in X
\]

4. MATHEMATICAL ANALYSIS

4.1. Neutrosophic Goal Programming
Goal programming can be written as
Find \( x = (x_1, x_2, ..., x_n)^T \)
to achieve:
\( z_i = t_i, \ i = 1, 2, ..., k \)
Subject to \( x \in X \) where \( t_i \) are scalars and represent the target achievement levels of the objective functions that the decision maker wishes to attain provided, \( X \) is feasible set of constraints.
The nonlinear goal programming problem can be written as
Find \( x = (x_1, x_2, ..., x_n)^T \)
So as to
Minimize \( z_i \) with target value \( t_i \), acceptance tolerance \( a_i \), indeterminacy tolerance \( d_i \), rejection tolerance \( c_i \)
\( x \in X \)
\( g_j(x) \leq b_j, \ j = 1, 2, ..., m \)
\( x_i \geq 0, \ i = 1, 2, ..., n \) with truth-membership, indeterminacy-membership and falsity-membership functions
Multi-Objective Welded Beam Optimization using Neutrosophic Goal …

\[
T_i^t(z_i) = \begin{cases} 
1 & \text{if } z_i \leq t_i \\
\left(\frac{t_i + a_i - z_i}{a_i}\right) & \text{if } t_i \leq z_i \leq t_i + a_i \\
0 & \text{if } z_i \geq t_i + a_i \\
0 & \text{if } z_i \leq t_i \\
\end{cases}
\]

\[
I_i^t(z_i) = \begin{cases} 
\left(\frac{z_i - t_i}{d_i}\right) & \text{if } t_i \leq z_i \leq t_i + a_i \\
\left(\frac{t_i + a_i - z_i}{a_i - d_i}\right) & \text{if } t_i + d_i \leq z_i \leq t_i + a_i \\
0 & \text{if } z_i \geq t_i + a_i \\
0 & \text{if } z_i \leq t_i \\
\end{cases}
\]

\[
F_i^t(z_i) = \begin{cases} 
\left(\frac{z_i - t_i}{c_i}\right) & \text{if } t_i \leq z_i \leq t_i + c_i \\
1 & \text{if } z_i \geq t_i + c_i \\
\end{cases}
\]

To maximize the degree of acceptance and indeterminacy of nonlinear goal programming (NGP) objectives and constraints also to minimize degree of rejection of NGP objectives and constraints,

\[
\text{Maximize } T_i^t(z_i), \quad i = 1, 2, \ldots, k
\]

\[
\text{Maximize } I_i^t(z_i), \quad i = 1, 2, \ldots, k
\]

\[
\text{Minimize } F_i^t(z_i), \quad i = 1, 2, \ldots, k
\]

Subject to

\[
0 \leq T_i^t(z_i) + I_i^t(z_i) + F_i^t(z_i) \leq 3, \quad i = 1, 2, \ldots, k
\]

\[
T_i^t(z_i) \geq 0, I_i^t(z_i) \geq 0, F_i^t(z_i) \quad I = 1, 2, \ldots, k
\]

\[
T_i^t(z_i) \geq I_i^t(z_i), \quad I = 1, 2, \ldots, k
\]

\[
T_i^t(z_i) \geq F_i^t(z_i), \quad i = 1, 2, \ldots, k
\]

\[
g_j(x) \leq b_j, \quad j = 1, 2, \ldots, m
\]

\[
x_i \geq 0, \quad i = 1, 2, \ldots, n
\]

where \( T_i^t(z_i) \), \( I_i^t(z_i) \) and \( F_i^t(z_i) \) are truth membership function, indeterminacy membership function, falsity membership function of neutrosophic decision set respectively.
Now the neutrosophic goal programming (NGP) in model (2) can be represented by crisp programming model using truth membership, indeterminacy membership, and falsity membership functions as

Maximize $\alpha$, Maximize $\gamma$, Minimize $\beta$

$T_{z_i}(z_i) \geq \alpha, i = 1, 2, \ldots, k$

$I_{z_i}(z_i) \geq \gamma, i = 1, 2, \ldots, k$

$F_{z_i}(z_i) \leq \beta, i = 1, 2, \ldots, k$

$z_i \leq t_i, i = 1, 2, \ldots, k$

$0 \leq \alpha + \beta + \gamma \leq 3$

$\alpha, \gamma \geq 0, \beta \leq 1$

$g_j(x) \leq b_j, j = 1, 2, \ldots, m$

$x_i \geq 0, i = 1, 2, \ldots, n$

4.2. Generalized Neutrosophic Goal Programming

The generalized neutrosophic goal programming can be formulated as

Maximize $T_{z_i}(z_i), i = 1, 2, \ldots, k$

Maximize $I_{z_i}(z_i), i = 1, 2, \ldots, k$

Minimize $F_{z_i}(z_i), i = 1, 2, \ldots, k$

Subject to

$0 \leq T_{z_i}(z_i) + I_{z_i}(z_i) + F_{z_i}(z_i) \leq w_1 + w_2 + w_3, \ i = 1, 2, \ldots, k$

$T_{z_i}(z_i) \geq 0, I_{z_i}(z_i) \geq 0, F_{z_i}(z_i) I = 1, 2, \ldots, k$

$T_{z_i}(z_i) \geq I_{z_i}(z_i), I = 1, 2, \ldots, k$

$T_{z_i}(z_i) \geq F_{z_i}(z_i), i = 1, 2, \ldots, k$

$0 \leq w_1 + w_2 + w_3 \leq 3$

$w_1, w_2, w_3 \in [0, 1]$

$g_j(x) \leq b_j, j = 1, 2, \ldots, m$

$x_i \geq 0, i = 1, 2, \ldots, n$

Equivalently

Maximize $\alpha$, Maximize $\gamma$, Minimize $\beta$

$T_{z_i}(z_i) \geq \alpha, i = 1, 2, \ldots, k$

$I_{z_i}(z_i) \geq \gamma, i = 1, 2, \ldots, k$

$F_{z_i}(z_i) \leq \beta, i = 1, 2, \ldots, k$
Multi-Objective Welded Beam Optimization using Neutrosophic Goal ... 523

\[ z_i \leq t_i, i = 1,2,\ldots,k \]
\[ 0 \leq \alpha + \beta + \gamma \leq w_1 + w_2 + w_3; \]
\[ \alpha \in [0,w_1], \gamma \in [0,w_2], \beta \in [0,w_3]; \]
\[ w_1 \in [0,1], w_2 \in [0,1], w_3 \in [0,1]; \]
\[ 0 \leq w_1 + w_2 + w_3 \leq 3; \]
\[ g_j(x) \leq b_j, j = 1,2,\ldots,m \]
\[ x_j \geq 0, j = 1,2,\ldots,n \]

Equivalently

Maximize \( \alpha \), Maximize \( \gamma \), Minimize \( \beta \) \hspace{1cm} (5)

\[ z_i \leq t_i + a_i \left(1 - \frac{\alpha}{w_1}\right), i = 1,2,\ldots,k \]
\[ z_i \geq t_i + \frac{d_i}{w_2} \gamma, i = 1,2,\ldots,k \]
\[ z_i \leq t_i + a_i - \frac{\gamma}{w_2} (a_i - d_i), i = 1,2,\ldots,k \]
\[ z_i \leq t_i + \frac{c_i}{w_3} \beta, i = 1,2,\ldots,k \]
\[ z_i \leq t_i, i = 1,2,\ldots,k \]

0 \leq \alpha + \beta + \gamma \leq w_1 + w_2 + w_3;
\alpha \in [0,w_1], \gamma \in [0,w_2], \beta \in [0,w_3];
\[ w_1 \in [0,1], w_2 \in [0,1], w_3 \in [0,1]; \]
\[ 0 \leq w_1 + w_2 + w_3 \leq 3; \]
\[ g_j(x) \leq b_j, j = 1,2,\ldots,m \]
\[ x_j \geq 0, j = 1,2,\ldots,n \]

With the help of generalized truth, indeterminacy, falsity membership function the
generalized neutrosophic goal programming based on arithmetic aggregation operator
can be formulated as

\[ \text{Minimize} \left\{ \frac{1 - \alpha + \beta + (1 - \gamma)}{3} \right\} \] \hspace{1cm} (6)

Subjected to same constraints as (5)

With the help of generalized truth, indeterminacy, falsity membership function the
generalized neutrosophic goal programming based on geometric aggregation operator
can be formulated as

\[ \text{Minimize} \sqrt[3]{(1 - \alpha)(1 - \gamma)} \] \hspace{1cm} (7)

Subjected to same constraints as (5)
Now this non-linear programming problem (5 or 6 or 7) can be easily solved by an appropriate mathematical programming to give solution of multi-objective non-linear programming problem (1) by generalized neutrosophic goal optimization approach.

5. SOLUTION OF MULTI-OBJECTIVE WELDED BEAM OPTIMIZATION PROBLEM (MOWBP) BY GENERALIZED NEUTROSOPHIC GOAL OPTIMIZATION TECHNIQUE

The multi-objective neutrosophic fuzzy structural model can be expressed as

\[
\begin{align*}
\text{Minimize } & C(X) \quad \text{with target value } C_0, \text{truth tolerance } a_c, \text{indeterminacy tolerance } d_c \text{ and rejection tolerance } c_c \\
\text{minimize } & \delta(X) \quad \text{with target value } \delta_0, \text{truth tolerance } a_{\delta_0}, \text{indeterminacy tolerance } d_{\delta_0} \text{ and rejection tolerance } c_{\delta_0} \\
\text{subject to } & \sigma(X) \leq \left[\sigma\right] \\
& x_i^{\min} \leq x_i \leq x_i^{\max}
\end{align*}
\]

where \( X = [x_1, x_2, \ldots, x_n]^T \) are the design variables, \( n \) is the group number of design variables for the welded beam design.

To solve this problem we first calculate truth, indeterminacy and falsity membership function of objective as follows

\[
T_{C(X)}^{w_1}(C(X)) = \begin{cases} 
  w_1 \left( \frac{C_0 + a_c - C(X)}{a_c} \right) & \text{if } C(X) \leq C_0 \\
  0 & \text{if } C_0 \leq C(X) \leq C_0 + a_c \\
  0 & \text{if } C(X) \geq C_0 + a_c 
\end{cases}
\]

\[
T_{C(X)}^{w_2}(C(X)) = \begin{cases} 
  w_2 \left( \frac{C(X) - C_0}{d_c} \right) & \text{if } C_0 \leq C(X) \leq C_0 + a_c \\
  w_2 \left( \frac{C_0 + a_c - C(X)}{a_c - d_c} \right) & \text{if } C_0 + d_c \leq C(X) \leq C_0 + a_c \\
  0 & \text{if } C(X) \geq C_0 + a_c 
\end{cases}
\]

where \( d_c = \frac{w_1}{w_1 + \frac{w_2}{c_c}} \).
Multi-Objective Welded Beam Optimization using Neutrosophic Goal Optimization Technique: A Generalized Approach

According to the generalized neutrosophic goal optimization technique using truth, indeterminacy, and falsity membership functions, MOSOP (8) can be formulated as:

$$F_{C(X)}^{\alpha}(C(X)) = \begin{cases} 
0 & \text{if } C(X) \leq C_0 \\
\frac{w_1 (C(X) - C_0)}{c_c} & \text{if } C_0 \leq C(X) \leq C_0 + c_c \\
w_1 & \text{if } C(X) \geq C_0 + c_c 
\end{cases}$$

And

$$T_{\delta(X)}^{\alpha}(\delta(X)) = \begin{cases} 
w_1 & \text{if } \delta(X) \leq \delta_0 \\
\frac{(\delta_0 + a_{\delta} - \delta(X))}{a_{\delta}} & \text{if } \delta_0 \leq \delta(X) \leq \delta_0 + a_{\delta} \\
0 & \text{if } \delta(X) \geq \delta_0 + a_{\delta} 
\end{cases}$$

$$I_{\delta(X)}^{\alpha}(\delta(X)) = \begin{cases} 
0 & \text{if } \delta(X) \leq \delta_0 \\
w_2 \frac{(\delta(X) - \delta_0)}{d_{\delta}} & \text{if } \delta_0 \leq \delta(X) \leq \delta_0 + a_{\delta} \\
w_2 \frac{(\delta_0 + a_{\delta} - WT(X))}{a_{\delta} - d_{\delta}} & \text{if } \delta_0 + d_{\delta} \leq \delta(X) \leq \delta_0 + a_{\delta} \\
0 & \text{if } \delta(X) \geq \delta_0 + a_{\delta} 
\end{cases}$$

$$d_{\delta} = \frac{w_1}{w_1 + w_2} \frac{1}{a_{\delta} - c_{\delta}}$$

$$F_{\delta(X)}^{\alpha}(\delta(X)) = \begin{cases} 
0 & \text{if } \delta(X) \leq \delta_0 \\
\frac{w_3 (\delta(X) - \delta_0)}{c_{\delta}} & \text{if } \delta_0 \leq \delta(X) \leq \delta_0 + c_{\delta} \\
w_3 & \text{if } \delta(X) \geq \delta_0 + c_{\delta} 
\end{cases}$$

According to the generalized neutrosophic goal optimization technique using truth, indeterminacy, and falsity membership functions, MOSOP (8) can be formulated as:

**Model - I**

Maximize $\alpha$, Maximize $\gamma$, Minimize $\beta$

$$C(X) \leq C_0 + a_c \left(1 - \frac{\alpha}{w_1}\right),$$

$$C(X) \geq C_0 + \frac{d_{\delta}}{w_2} \gamma,$$
With the help of generalized truth, indeterminacy, falsity membership function the generalized neutrosophic goal programming based on arithmetic aggregation operator can be formulated as

**Model -II**

\[
\text{Minimize } \frac{(1-\alpha) + \beta + (1-\gamma)}{3}
\]

Subjected to same constraint as Model I

With the help of generalized truth, indeterminacy, falsity membership function the generalized neutrosophic goal programming based on geometric aggregation operator can be formulated as

**Model -III**

\[
\text{Minimize } \sqrt[3]{(1-\alpha)\beta(1-\gamma)}
\]
Subjected to same constraint as Model I
Now these non-linear programming Model-I,II,III can be easily solved through an appropriate mathematical programming to give solution of multi-objective non-linear programming problem (8) by generalized neutrosophic goal optimization approach.

6. NUMERICAL ILLUSTRATION

A welded beam (Ragsdell and Philips 1976, Fig. 2) has to be designed at minimum cost whose constraints are shear stress in weld ($\tau$), bending stress in the beam ($\sigma$), buckling load on the bar ($P$), and deflection of the beam ($\delta$). The design variables are

$$
\begin{bmatrix}
  x_1 \\
  x_2 \\
  x_3 \\
  x_4 \\
\end{bmatrix} =
\begin{bmatrix}
  h \\
  l \\
  t \\
  b \\
\end{bmatrix}
$$

where $h$ is the weld size, $l$ is the length of the weld, $t$ is the depth of the welded beam, $b$ is the width of the welded beam.

![Design of the welded beam](image)

**Fig. 2.** Design of the welded beam

**Cost Function**

The performance index appropriate to this design is the cost of weld assembly. The major cost components of such an assembly are (i) set up labour cost, (ii) welding labour cost, (iii) material cost.

$$
C(X) = C_0 + C_1 + C_2 \quad \text{where, } f(X) = \text{cost function; } C_0 = \text{set up cost; } C_1 = \text{welding labour cost; } C_2 = \text{material cost;}
$$

**Set up cost $C_0$**: The company has chosen to make this component a weldment, because of the existence of a welding assembly line. Furthermore, assume that
fixtures for set up and holding of the bar during welding are readily available. The cost $C_o$ can therefore be ignored in this particular total cost model.

**Welding labour cost $C_1$**: Assume that the welding will be done by machine at a total cost of $10/\text{hr}$ (including operating and maintenance expense). Furthermore suppose that the machine can lay down a cubic inch of weld in 6 min. The labour cost is then

$$C_1 = \left(10 \frac{\$}{\text{hr}}\right) \left(\frac{1 \text{ min}}{60 \text{ min}}\right) \left(6 \frac{\text{in}^3}{\text{min}}\right) = \left(\frac{\$}{\text{in}^3}\right) V_w.$$ Where $V_w =$ weld volume, in$^3$

**Material cost $C_2$**: $C_2 = C_3 V_w + C_4 V_B$. Where $C_3 =$ cost per volume per weld material.\$/in$^3 = (0.37)(0.283)$; $C_4 =$ cost per volume of bar stock.\$/in$^3 = (0.37)(0.283)$; $V_B =$ volume of bar, in$^3$. From geometry $V_w = h^2 l$; volume of the weld material(in$^3$) $V_{\text{weld}} = x_1^2 x_2$ and $V_B = tb (L + l)$; volume of bar (in$^3$) $V_{\text{bar}} = x_3 x_4 (L + x_2)$. Therefore cost function become

$$C(X) = h^2 l + C_3 h^2 l + C_4 tb (L + l) = 1.10471 x_1^2 x_2 + 0.04811 x_3 x_4 (14.0 + x_2).$$

**Engineering Relationship**

![Diagram](image)

**Fig 3.** Shear stresses in the weld group.

**Maximum shear stress in weld group**:

To complete the model it is necessary to define important stress states

Direct or primary shear stress $\tau_1 = \frac{\text{Load}}{\text{Throat area}} = \frac{P}{A} = \frac{P}{\sqrt{2hl}} = \frac{P}{\sqrt{2}x_1 x_2}$

Since the shear stress produced due to turning moment $M = P e$ at any section is proportional to its radial distance from centre of gravity of the joint ‘G’, therefore
stress due to $M$ is proportional to $R$ and is in a direction at right angles to $R$. In other words $\frac{\tau_2}{R} = \frac{\tau}{r} = \text{constant. Therefore } R = \sqrt{\left(\frac{l}{2}\right)^2 + \left(\frac{h + t}{2}\right)^2} = \sqrt{\frac{x^2}{4} + \left(\frac{x_1 + x_3}{2}\right)^2}$

Where, $\tau_2$ is the shear stress at the maximum distance $R$ and $\tau$ is the shear stress at any distance $r$. Consider a small section of the weld having area $dA$ at a distance $r$ from ‘G’. Therefore shear force on this small section $= \tau \times dA$ and turning moment of the shear force about centre of gravity $dM = \tau \times dA \times r = \frac{\tau_2}{R} \times dA \times r^2$. Therefore total turning moment over the whole weld area $M = \frac{\tau_2}{R} \int dA \times r^2 = \frac{\tau_2}{R} J$. where $J = \text{polar moment of inertia of the weld group about centre of gravity. Therefore shear stress due to the turning moment i.e. secondary shear stress, } \tau_2 = \frac{MR}{J}$. In order to find the resultant stress, the primary and secondary shear stresses are combined vectorially. Therefore the maximum resultant shear stress that will be produced at the weld group,

$\tau = \sqrt{\tau_1^2 + \tau_2^2 + 2 \tau_1 \tau_2 \cos \theta}$, where, $\theta = \text{Angle between } \tau_1 \text{ and } \tau_2$. As $\cos \theta = \frac{l/2}{R} = \frac{x_2}{2R}$; $\tau = \sqrt{\tau_1^2 + \tau_2^2 + 2 \tau_1 \tau_2 \frac{x_2}{2R}}$.

Now the polar moment of inertia of the throat area $(A)$ about the centre of gravity is obtained by parallel axis theorem,

$J = 2 \left[ I_{xx} + A + x^2 \right] = 2 \left[ \frac{A \times l^2}{12} + A \times x^2 \right] = 2A \left( \frac{l^2}{12} + x^2 \right) = 2 \left[ \sqrt{2} x_1 x_2 \cdot \left( \frac{x^2}{12} + \frac{(x_1 + x_3)^2}{2} \right) \right]$.

Where, $A = \text{throat area} = \sqrt{2} x_1 x_2$, $l = \text{Length of the weld}$, $x = \text{Perpendicular distance between two parallel axes} = \frac{t}{2} + \frac{h}{2} = \frac{x_1 + x_3}{2}$.

**Maximum bending stress in beam:**

Now Maximum bending moment $= PL$, Maximum bending stress $= \frac{T}{Z}$, where $T = PL$;
Z = section modulus = \( \frac{I}{y} \); \( I \) = moment of inertia = \( \frac{bt^3}{12} \); \( y \) = distance of extreme fibre from centre of gravity of cross section = \( \frac{t}{2} \); Therefore \( Z = \frac{bt^2}{6} \). So bar bending stress

\[
\sigma(x) = \frac{T}{Z} = \frac{6PL}{bt^2} = \frac{6PL}{x_3x_3^2}.
\]

**Maximum deflection in beam:**

Maximum deflection at cantilever tip = \( \frac{PL^3}{3EI} = \frac{PL^3}{3E\frac{bt^3}{12}} = \frac{4PL^3}{Ebt^3} \)

**Buckling load of beam:**

buckling load can be approximated by \( P_C(x) = \frac{4.013\sqrt{EI}}{l^2} \left(1 - \frac{a}{l} \sqrt{\frac{El}{C}} \right) \)

where, \( I \) = moment of inertia = \( \frac{bt^3}{12} \); torsional rigidity \( C = GJ = \frac{1}{3}tb^3G; l = L; a = \frac{t}{2} \);

\[
= \frac{4.013 \sqrt{E t^2 b^6}}{L^2} \left(1 - \frac{1}{2L} \sqrt{\frac{E}{4G}} \right) = \frac{4.013 \sqrt{EGx_3x_4^6}}{L^2} \left(1 - \frac{x_3}{2L} \sqrt{\frac{E}{4G}} \right);
\]

The single-objective optimization problem can be stated as follows

Minimize \( C(X) \equiv 1.10471x_1^2x_2 + 0.04811(14 + x_2)x_3x_4 \)

(9)

Minimize \( \delta(x) \equiv \frac{4PL^3}{Ex_3x_3^2} \);

</table>

Here we almost same solutions for the different value of $w_1, w_2, w_3$ in different aggregation method for objective functions. From Table 2 it is clear that the cost of
welding and deflection are almost same in fuzzy and intuitionistic fuzzy as well as neutrosophic optimization technique. Moreover it has been seen that desired value obtained in different aggregation method have not affected by variation of methods in perspective of welded beam design optimization.

7. CONCLUSIONS

The research study investigates that neutrosophic goal programming can be utilized to optimize a nonlinear welded beam design problem. The results obtained for different aggregation method of the undertaken problem show that the best result is achieved using geometric aggregation method. The concept of neutrosophic optimization technique allows one to define a degree of truth membership, which is not a complement of degree of falsity; rather, they are independent with degree of indeterminacy. As we have considered a non-linear welded beam design problem and find out minimum cost of welding of the structure as well as minimum deflection, the results of this study may lead to the development of effective neutrosophic technique for solving other model of nonlinear programming problem in different field.
